

3RD-WEB-HACK

FairLance

Freelance payments that move with the work.

Milestone escrow + a staked dispute jury

Lock > Build > Verify > Resolve > Pay

Sepolia prototype • all ETH is test ETH

Freelance work starts with a trust gap.

Today, one side carries the risk before value changes hands.

- **Funds move too early**
a full advance exposes the client before delivery.
- **Work moves too early**
a full handoff exposes the freelancer before payment.
- **Disputes stall**
platforms mediate slowly - or the parties fight off-chain.

The missing layer: neutral settlement at the pace of milestones.

One contract. Milestone by milestone.

Funds stay locked until work is approved - or a dispute reaches a verdict.

- 1 **Post job** - scope + milestone amounts
- 2 **Fund** - client locks test ETH
- 3 **Submit** - work hash + evidence
- 4 **Approve** - release that milestone

Only the milestone in question enters dispute. The rest of the project stays on track.

Disputes become a protocol - not a support ticket.

A small, staked jury turns review into an accountable on-chain decision.

- 1 **Dispute** - work hash + evidence
- 2 **Select** - 3 pseudo-random jurors
- 3 **Vote** - independent votes, 2 / 3 majority wins
- 4 **Settle** - honest jurors earn a fee, losing-side jurors are slashed

Staking makes verdict quality an economic behavior.

Built to ship, easy to inspect.

A narrow on-chain core with a familiar web3 interface keeps the prototype feasible.

- **Smart contract: Solidity + Hardhat**
jobs, milestones, escrow, jurors, voting, slashing
- **Network: Sepolia testnet**
wallet-signed actions, test ETH only
- **App: Next.js + wagmi + viem + RainbowKit**
client, freelancer and juror views

Contract logic owns money and verdicts. The interface owns clarity.

Six clicks prove the whole loop.

One project moves from agreement to a contested milestone and final payout.

- 1 **Post job** - client
- 2 **Fund milestones** - client
- 3 **Submit work** - freelancer
- 4 **Trigger dispute** - client
- 5 **Cast votes** - 3 jurors
- 6 **See payout** - contract

Every critical state change is visible, wallet-signed, and reproducible on Sepolia.

Less blind trust. More accountable work.

FairLance combines payment rails and dispute incentives in one project lifecycle.

- **Clients risk only the active milestone**
funds stay in escrow until approval or verdict
- **Freelancers make progress payable**
completed milestones settle without waiting
- **Jurors earn for useful judgment**
stake ties review quality to consequences

Milestone escrow + staked jury + slashing = accountable settlement

A reusable settlement primitive for remote work.

From hackathon loop to work protocol.

The prototype proves settlement. The roadmap deepens evidence, identity, and governance.

- **Now: Sepolia MVP**
milestone escrow, 3-juror disputes, 3-role interface
- **Next: safer verdicts**
encrypted evidence, juror reputation, appeal windows
- **Later: open marketplace**
stablecoin settlement, cross-chain, DAO-tuned parameters

Start narrow. Prove the incentive loop. Expand only after the verdict mechanism earns trust.
